

ABSTRACT OF THE DISCLOSURE

The present invention concerns a moveable children's potty training chair with bottom-rinsing function. The said potty training chair has a toilet seat body formed in one piece, with the power source and rinsing button installed
5 on one side of the toilet seat body, and a sprinkle-nozzle installed at the rear of the toilet seat body. A water-storage tank is installed beneath the gathering basin, the water outlet of the water-storage tank is connected to the water inlet of the pumping motor by a duct, and the water outlet of the pumping motor is then connected to the sprinkle-nozzle by a conduit. When children need to
10 rinse their bottom after going to the toilet, all it requires is a gentle push of the rinsing button, and water from the water-storage tank will be pumped to the sprinkle-nozzle by the pumping motor to rinse clean the bottom. This will provide children a potty training chair design more suitable for child usage, sanitary, less germ-infection, light and convenient, no limitation on places for
15 application, easier to carry, and help the defecation by the water massage.
